COMPOSIO · APM (TOOLKITS) TAKE-HOME

OAuth App Guides

Yashvi Bansal
22 Oct 2026

Verified setup and approval paths for the provider OAuth apps an AI agent depends on, with a live agent that researches any app and re-checks every claim against the provider's own docs.

LIVE APP	SOURCE CODE	VERIFICATION REPORT
oauth-guides-web.vercel.app Curated guides · live generation	**github.com/yb0203/oauth-app-guides** The README is the assessment doc	**docs/VERIFICATION.md** What we checked, fixed, couldn't verify

1 Five-minute review path

1 See a verdict change

Open the **Gmail guide** and toggle *Your situation*. Internal-only goes from **Review required** to **Instant**. Hover any citation number for the exact quote and source.

2 Ask the guide

"*Can I avoid Google review?*" The answer cites only this guide's verified evidence, and **Apply** sets your situation for you.

3 Generate a new guide live

On the **home page**, type an app we never researched (*Zoom*, *Dropbox*, *Asana*). It takes about a minute on free models.

2 How a guide is made

Resolve Composio catalog › **Find docs** Provider's official pages › **Extract** Claims with exact quotes › **Probe** Sign-in wall › **Write** Schema-checked › **Verify** Every quote, live › **Publish** Permalink, export

Code · Free LLM · Every fact is labeled TESTED DOCS COMMUNITY UNCERTAIN (DOCS = quote re-found live, by code)

3 How this meets the brief

THE BRIEF ASKS	WHERE IT'S ANSWERED
How easy or difficult the OAuth app is to get ready	A verdict with one of 4 tiers (Instant · Verify to scale · Review required · Partner only) on a ladder, with confidence, re-rendered from *Your situation*.
Time and effort, including the approval wait	Separate **Your work** and **Waiting on the provider** tiles; the official vs. community-reported wait; cost.
Requirements and nuances	Before you start · Limits (value, unit, scope) · Customer-side gates · Gotchas · Conflicts where the provider's docs disagree.
What the agent does vs. where you take over	Every step is tagged **You** (with the reason), **Agent** or **Either**; *Prepared for you* holds drafted scopes, justifications and consent-screen values.
Use agents to investigate and attempt setup	The live pipeline above, run for every new app. A setup-attempt experiment (5 apps) found every console stops at sign-in, which shaped the design.
Be clear about what was tested, sourced or uncertain	Four evidence labels on every fact, an evidence summary per guide, citation hover cards, and conflicts shown, never hidden.
A library of guides; a few varied apps	5 curated guides covering all 4 tiers (GitHub, Xero, Gmail, Shopify, Spotify) plus a 100-app catalog from Composio's toolkits.
Live, shareable guide for any app	Streamed progress → a permanent link, Markdown export and print. Tested on Todoist, Zoom, Dropbox, Asana, Calendly and Notion.
What to do when blocked	*When you're blocked* (symptom → cause → fix), plus grounded **Ask this guide** with Apply actions.
Check a sample; show corrections	VERIFICATION.md: about 75 research quotes re-checked, the setup experiment, 247 live quote checks, 3 eval rounds, performance and cost.

4 Key decisions

A verification process, not a prompt

Answers from memory were wrong or stale (Spotify's user cap, GitHub's token default, the difficulty tiers). Checking against live docs is the product.

No pretend automation

Agents can't create OAuth apps: all 5 consoles stopped at sign-in. So the agent probes, researches and drafts, and hands off cleanly.

Code verifies, models write

Search, the probe, quote checks, labels and tier rules are deterministic. The LLM only extracts and writes, and its output is schema-validated.

Bring-your-own first, free models only

Guides always cover registering your own app. Runtime uses free OpenRouter models behind a server allow-list; Claude Code was used to build and test only.

5 Results

3 / 3
Tier accuracy on our answer key
(round 1: 1.5 / 3)

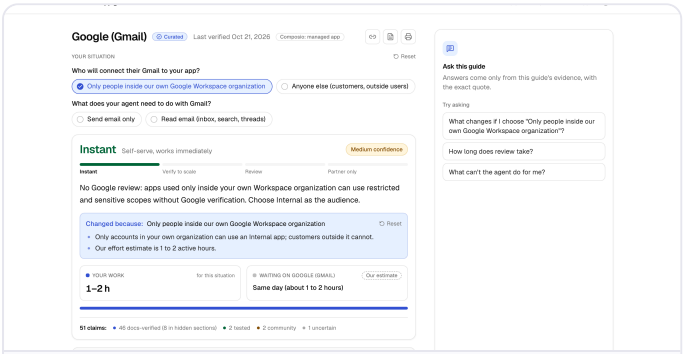

0
Inflated evidence labels in every eval round

≈ 66 s
Per guide, default free model (8 production runs)

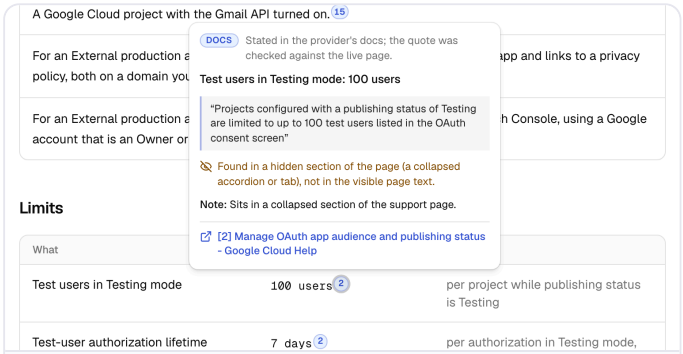

$0
Actual spend · ≈ 33k tokens per guide
(≈ $0.03 on a paid model)

Also: 247 live quote checks on curated guides · about 75 research quotes re-checked (1 citation fixed) · a quote-checker bug found and fixed (hidden page sections) · 420 backend tests.

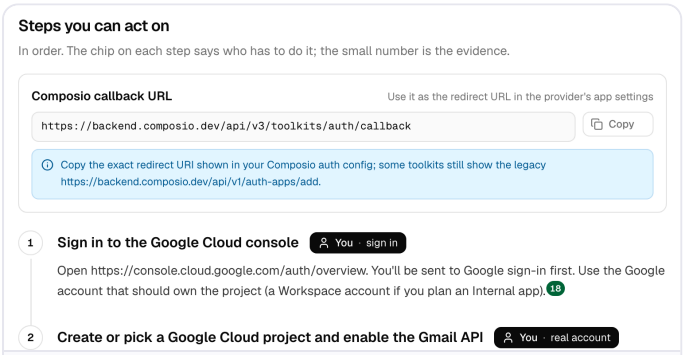

6 Product screenshots

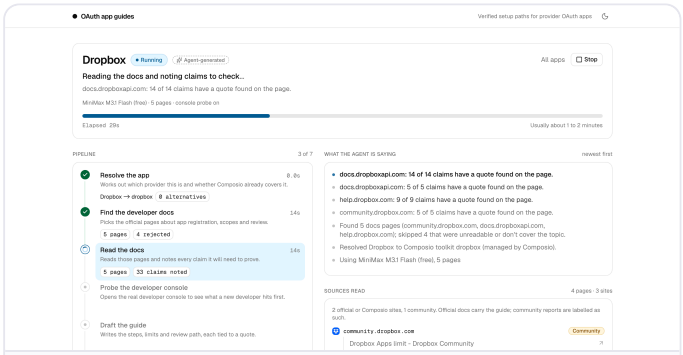

Your situation → the verdict flips to Instant, with work vs. wait

Citation → exact quote, found in a collapsed section, with source

Steps → who does it, the Composio callback, copyable values

Live generation → a never-researched app (Dropbox), streaming

7 Limitations

Anything behind a console login is unverified and marked UNCERTAIN. Generated guides take about 1–1.5 minutes, and their permalinks can expire on a cold start; curated guides are permanent. Production has no headless browser, so docs that render only with JavaScript may be UNCERTAIN there. Free models sometimes miss numeric caps. A production stream once went silent while the run continued; the page now recovers via a run-status check. Full detail is in the README and VERIFICATION.md.
